Synechocystis sp. (strain:PCC6803) DNA.

Synechocystis sp.
Bacteria; Cyanobacteria; Chroococcales; Synechocystis.
carbon dioxide concentrating mechanism protein Ccmk; carboxyl-terminal protease; cell division FtsZ protein; cell division protein FtsB; ofloroplast division protein FtsB; ofloroplast import-associated channel IAP75; chorismate synthase; cysteine synthase; cytoplasmic membrane protein for maltose uptake; oytosine deaminase; exclinclease ABC subunit A; ferredoxin; glucose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kaneko, T., Sato, S., Kotani, H., Tanaka, A., Asamizu, E., Nakamura, Y., Miyajima, N., Hirosawa, M., Sugiura, M., Sasamoto, S., Kimura, T., Hosouchi, T., Matsuno, A., Muraki, A., Nakazaki, N., Naruo, K., Okumura, S., Shimpo, S., Takeuchi, C., Wada, T., Watanabe, A., Yamada, M., Yasuda, M. and Tabata, S. Sequence analysis of the genome of the unicellular cyanobacterium Synechocystis sp. strain PCC6803. II. Sequence determination of the entire genome and assignment of potential protein-coding regions 97061201
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Direct Submission
Submitted (28-JUN-1996) to the DDBJ/EMBL/GenBank databases. Satoshi

FEATURES

Even though 'tga' is a nonsense or termination (opal) codon throughout prokaryotes and eukaryotes, it codes for tryptophan in M.capricolum, as is the case in mitochondria. The sequence of the S3 and L16 ribosomal protein genes from this wall-less bacterium include 'tga' codons in their reading frames in positions corresponding to tryptophan in E.coli S3 and L16 genes. A Trp-tRNA with the opal suppressing anticodon 'tca' is found in M.capricolum dyad symmetry, which could be a transcription-termination structure is found at positions 614-640. .. 0 1 (bases 1 to 994)

Contributed on tape April 1983 by M.Sprinzl & D.H.Gauss; from their entries 1810, 1811, 1814 in Nucleic Acids Res. 11, r1-r54 (1983). [1] suggests that 'uga' suppression is carried out by a Trp-tRNA whose anticodon-recognition is altered by a change outside the anticodon. [2] discusses the mutational effects on the in vitro and in vivo properties of Trp-tRNA.
                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                mRNA
only a small overlap as described above. This sequence is the entire insert of clone 501M12. This sequence has been finished according to sequence and criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key. This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed in collaboration by the Sanger Centre chromosome 6 mapping group and Armin Volz 6 Andreas Ziegler. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6/501M12 is from the library RPCI3 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://bacpac.med.buffalo.edu/ VECTOR: pCYPAC2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .29087,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /translation-"RRYLQEQAYRLQOGIVTSTTQQMIDRICVKVQDHLNSLRNCGGD

Submitted (06-JUL-1998) E-mail enquires: humquery@sanger.ac.uk clone requests: clonerequest&sanger.ac.uk clone requests: clonerequest&sanger.ac.uk clone requests: clonerequest&sanger.ac.uk clonered.ii 1998 this sequence version replaced gi:2980811. During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens DNA sequence from clone 501N12 on chromosome 6p22.1-22.3 Contains a gene almost identical to four genes of unknown function, a pseudogene, three (pseudo?) genes of unknown function, an unknown gene similar to a rat EST, a PX19 LIKE pseudogene and another unknown gene. Contains ESTs, STSS and GSSs, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Cambridgeshire, CB10 1SA, UK. E-mail enquires:

humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

On Jan 18, 1998 this sequence version replaced gi:2558561.

IMPORTANT: This sequence is the entire insert of clone 451B15. This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre chromosome 6

mapping group. Further information can be found at

http://www.sanger.ac.uk/HGP/Chr6/

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the forter of the forter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     feature key.

The true left end of clone 451B15 is at 1 in this sequence. The true right end of clone 451B15 is at 186510.
451B15 is from the library RPC13 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong.

IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and the release of this data is based on the understanding that the contaminated with foreign sequence from E.coli, yeast, vector, phage eas work continues. The sequence may be contaminated with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate segments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .20531,
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence was generated from part of bacterial clone contigs of human chromosome 1, constructed by the Sanger Centre Chromosome 1 Mapping Group. Further information can be found at
                                                                                                                                                                                                                            neighbouring submissions.

The true left end of clone dJ423N22 is at 121681 in this sequence. This sequence map be finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                              IMPORTANT: This sequence is not the entire insert of clone 774124. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       http://www.sanger.ac.uk/HGP/Chrl
774124 is from the library RPC14 constructed at the Roswell Park
Cancer Institute by the group of Pieter de Jong. For further
details see http://bacpac.med.buffalo.edu/ VECTOR: pCYPAC2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         repeat_region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        repeat_region
                                                                                                                                                                                The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7, send mailto:egreen@nhgri.nih.gov/ or see http://genome.wustl.edu/gsc
                                                                                                                                                                                                                                                                                                                                                          This clone was derived from human PAC library RPCI-5, prepared by Pieter de Jong and coworkers at the Roswell Park Cancer Institute (http://bacpac.med.buffalo.edu) using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The clone sequenced to the left is DJ1048B16. Actual start of this clone is at base position i or DJ1161G23; actual end is at 119483 of DJ1161G23.
                                                            all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                           This sequence was finished as follows unless otherwise noted:
                                                                                                                                                                                                                                                                                                                                                                                                                                                The clone may be obtained either from Genome Systems, Inc. (http://www.genomesystems.com) or Research Genetics, Inc. (http://www.resgen.com); or from Pieter de Jong.

IMPORTANT: This sequence is unfinished and does not necessarily

represent the correct sequence. Work on the sequence is in progress

and the release of this data is based on the understanding that the
contaminated with forteign sequence from E.coli, yeast, vector,

phage etc. Order of segments is not known: 800 n's separate

sequence may change as work conting. Dil. 00859 acc-

* NOTE: This is a "working draft' sequence. It currently consists of 78 contigs. The true order of the pieces stin not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as trus of N but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence as soon as it is available and the accession number will
* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AC007491 91047 bp DNA HTG 06-MAY-1999

Clone requests: clonerequest(sanger.ac.uk
On Aug 21, 1998 this sequence version replaced gi:3280011.
During sequence assembly data is comparated from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

IMPORANAT: This sequence is not the entire insert of clone 1044017. It may be shorter because we arrange for a small overlap between neighbouring submissions.

The true left end of clone 50413 (292545) is at 12226 in this sequence. This sequence has been finished according to sequence map problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu).
Where the sequence is ambiguous, there is an annotation using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence was generated from part of bacterial clone contigs of human chromosome X, constructed by the Sanger Centre Chromosome X Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/ChrX 1044017 is from the library RPCI5 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. a variable number tandem repeat (VNTR) region that gives rise to five allelles. This product is used for predicting the risk of osteoporosis in subject by determining the allelic and genetic polymorphism pattern for IL-1RN in genomic DNA. A pattern of at least one copy of the IL-1RN allele 2 indicates an increased susceptibility to osteoporosis. The methods can predict low bone mineral density (BMD) and the rate of bone density loss and thereby a susceptibility to osteoporosis. Individuals so identified can then be treated more aggressively to prevent or retard the occurrence of disease.
                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 9; Page 10; 36pp; English.

A method has been developed for the diagnosis of osteoporosis comprising determining the genotype of an interleukin-1 (IL-1) receptor antagonist gene (IL-IRN). The present sequence represents a PCR primer adapted to amplify a portion of introm 2 of an IL-IRN for use in the method of the invention. The method can be used for the diagnosis of disease, including diagnosis of osteoporosis and predisposition or susceptibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        IL-1 receptor antagonist gene intron 2 PCR primer #2.

A method has been developed for the diagnosis of osteoporosis comprising
determining the genotype of an interleukin-1 (IL-1) receptor antagonist
gene (IL-1RN). The present sequence represents the human interleukin-1
gene (IL-1RN). The present sequence represents the human interleukin-1
disease, including diagnosis of osteoporosis and predisposition or
susceptibility to osteoporosis and for therapy.

While you would your the presence of an IL-1 (44112332)

The processors of proteins produced by the IL-1 gene cluster

Claim 3; Page 33; 49pp. English.

Comparison of proteins produced by the IL-1 gene cluster

Claim 3; Page 33; 49pp. English.

Comparison of an inflammatory disorder. The method comprises the detection of an interleukin 1 (IL-1) (44112332) haplotype in a sample obtained from the classorder. Xi6607 to Xi6631 represent PCR primer used in the method for detecting the IL-1 (44112332) haplotype. The method provides kits for the early prediction of a patient's susceptibility to an inflammatory content of a patient's susceptibility to inflammatory disorders, including coronary artery disease, osteoporosis, nephropathy aloabetes mellitus, alopecia areata, Graves diseases, systemic lupus contents, comparising diabetic retinopathy, juvenile chronic arthritis, alobetes mellitus, alopecia areata, Graves diseases, systemic lupus contents, comprising diabetic retinopathy, juvenile chronic arthritis, disease-associated haplotype can be applied to particular inflammatory disease-associated haplotype enables determination of which alleles are causative, and this information is useful in designing treatment contents. Comparising gene therapy and treatment using various agents that modulate the activity of proteins produced by the IL-1 gene cluster contrally in the pathology of these diseases. Therefore, the use of IL-1 contrally in the pathology of these diseases. Therefore, the use of IL-1 diffammatory diseases, including those with a molivenic component contrally in the pathology of these sets diseases. Therefore is to long with a molivenic component.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

Claim 1: Page 451: 10pp: Japanese Claim 1: Page 451: 10pp: Japanese Protein is derived from 10 exons of the gene widely spaced by introns up to 6.0kb in length. When inserted into a suitable expression vector host animal cells can be used to produce human alpha-2-plasmin inhibitor, useful in diagnosis and therapy of the plasmin inhibitor defficiency disease.                                                                                                                                           The nucleotide sequence of the novel cysteine synthase enzyme from The nucleotide sequence of the novel cysteine synthase enzyme from a papinach, Spinacia oleracea. The probes (07414-5) were used to obtain a clone from a cDNA library derived from spinach seedling leaves. The 1.5 kb insert was ligated into the cloning vectors pUC19 and M13mp18. The gene, 1483 bp, encodes a protein of 383 a.a. The cysteine gene is expressed in plants to elevate the cysteine content in the plant. The nutritional and feed value of the plant are expected to be enriched. Cysteine, one of the 5-containing amino acids, can be used as materials for various pharmaceuticals, food additives or cosmetics. Production of the protein is a useful step in the production of cysteine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Chitin biosynthetic enzymes end I, exo I and exo II - are periplasmic chito:dextrinase(s), periplasmic beta-GlcNAcidase(s) and aryl beta-N-acetyl:qluco:amidase(s), respectively Example 4; Page 78-79; IOIPp; English. Periplasmic chitodextrinase (W02156), periplasmic chitodextrinase (W02156), periplasmic beta-N-acetylglucosaminidase (W02158) and aryl beta-N-acetylglucosaminidase (W02158) can be used to produce chitin oligosaccharides with the structure (GlcNAc)n where n is 2 or higher, by contacting them with soluble chitin. The enzymes are encoded by the genes end!, exoI and exxII respectively. They are all genes involved in the catabolic pathway of chitin. Sequence 2951 BP; 629 A; 960 C; 880 G; 482 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 6: Page 17-41; 93pp; English.
This sequence encodes an enzyme which has cyclosporin synthetase-like activity. This sequence was isolated from Tolypocladium niveum (formerly known as T. inflatum GAMS). The enzyme encoded by this sequence catalyses the peptide biosynthesis of cyclosporins and structurally related molecules. This sequence may be used for the production of cyclosporin by transforming a vector containing this sequence in to a recombinant host. This allows effective production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      T. niveum Cyclosporin synthetase gene.
